## ***ASPARTYL PROTEASE INHIBITORS***

### **PRIORITY CLAIM**

[0001] The present application claims priority to co-pending applications U.S.S.N. 60/430,693, filed December 3, 2002, and U.S.S.N. 60/389,194, filed June 17, 2002; the entire contents of each of these applications are incorporated herein by reference.

### **BACKGROUND OF THE INVENTION**

[0002] Alzheimer's Disease is a progressive dementia in which massive deposits of aggregated protein breakdown products ( $\beta$ -amyloid plaques and neurofibrillary tangles) accumulate in the brain, resulting in the loss of memory, cognition, reasoning, judgement, orientation, and eventually death. Current therapies for the treatment of Alzheimer's Disease include, but are not limited to, donepezil and tacrine. These therapies are useful for improving the memory of patients during the early stages of Alzheimer's Disease, however they do not modify the progression of aggregated protein breakdown products underlying the pathology of Alzheimer's Disease. It would be desirable to develop therapies that would either stop or slow down this process of aggregation.

[0003] As described above, a defining feature of Alzheimer's Disease which is often used during clinical diagnosis is the presence of  $\beta$ -amyloid plaques and neurofibrillary tangles.  $\beta$ -amyloid plaques are predominantly composed of amyloid  $\beta$  peptide ( $A\beta$  (or  $\beta A4$ ), which is derived by proteolysis of the amyloid precursor protein (APP). Proteolysis of the amyloid precursor protein is effected by several enzymes called secretases. More specifically, cleavage of APP at the N-terminus of the  $A\beta$  peptide by  $\beta$ -secretase and at the C-terminus by one or more  $\gamma$ -secretases constitutes the  $\beta$ -amyloidogenic pathway, *i.e.*, the pathway by which  $A\beta$  is formed. It is believed that  $A\beta$  peptide accumulates as a result of this APP processing by  $\beta$ -secretase and thus inhibition of this enzyme's activity is desirable for the treatment of Alzheimer's Disease. For example, *in vivo* processing of APP at the  $\beta$ -secretase cleavage site is thought to be a rate limiting step in  $A\beta$  production, and is thus believed to be a therapeutic target for Alzheimer's Disease (Sabbagh *et al. Alz. Dis. Rev.* 1997, 3, 1-19). Recently, an aspartyl protease (known as BACE, Asp2, Memapsin) has been identified as the enzyme responsible for processing of APP at

the  $\beta$ -secretase cleavage site (see, for example, Vassar, *et al. Science*, 1999, 286, 735-741; Yan *et al. Nature*, 1999, 402, 533-537; Sinha *et al. Nature*, 1999, 402, 537-540; and Hussain *et al. Mol. Cell. Neurosci.* 1999, 14, 419-427).

[0004] Because it is believed that BACE plays an important role in the development and pathogenesis of Alzheimer's Disease, there has been increasing interest in the development of inhibitors of BACE as treatments (and possibly as preventative agents) for Alzheimer's Disease and other disorders caused by the accumulation of  $\beta$ -amyloid plaques. There remains a need, however, for the development of novel therapeutics capable of inhibiting the activity of this aspartyl protease. In particular, it would be desirable to develop therapeutics capable of selectively inhibiting BACE.

#### DEFINITIONS

[0013] Certain compounds of the present invention, and definitions of specific functional groups are described in more detail below. For purposes of this invention, the chemical elements are identified in accordance with the Periodic Table of the Elements, CAS version, Handbook of Chemistry and Physics, 75<sup>th</sup> Ed., inside cover, and specific functional groups are generally defined as described therein. Additionally, general principles of organic chemistry, as well as specific functional moieties and reactivity, are described in "Organic Chemistry", Thomas Sorrell, University Science Books, Sausalito: 1999, the entire contents of which are incorporated herein by reference. Furthermore, it will be appreciated by one of ordinary skill in the art that the synthetic methods, as described herein, utilize a variety of protecting groups. By the term "protecting group", as used herein, it is meant that a particular functional moiety, *e.g.*, O, S, or N, is temporarily blocked so that a reaction can be carried out selectively at another reactive site in a multifunctional compound. In preferred embodiments, a protecting group reacts selectively in good yield to give a protected substrate that is stable to the projected reactions; the protecting group must be selectively removed in good yield by readily available, preferably nontoxic reagents that do not attack the other functional groups; the protecting group may form an easily separable derivative (more preferably without the generation of new stereogenic centers); and the protecting group has a minimum of additional functionality to avoid further sites of reaction. As detailed herein, oxygen, sulfur, nitrogen and carbon protecting groups may be utilized. For example, in certain embodiments, as detailed herein, certain exemplary oxygen

protecting groups are utilized. These oxygen protecting groups include, but are not limited to methyl ethers, substituted methyl ethers (*e.g.*, MOM (methoxymethyl ether), MTM (methylthiomethyl ether), BOM (benzyloxymethyl ether), PMBM (p-methoxybenzyloxymethyl ether), to name a few), substituted ethyl ethers, substituted benzyl ethers, silyl ethers (*e.g.*, TMS (trimethylsilyl ether), TES (triethylsilylether), TIPS (triisopropylsilyl ether), TBDMS (t-butyldimethylsilyl ether), tribenzyl silyl ether, TBDPS (t-butyldiphenyl silyl ether), to name a few), esters (*e.g.*, formate, acetate, benzoate (Bz), trifluoroacetate, dichloroacetate, to name a few), carbonates, cyclic acetals and ketals. In certain other exemplary embodiments, nitrogen protecting groups are utilized. These nitrogen protecting groups include, but are not limited to, carbamates (including methyl, ethyl and substituted ethyl carbamates (*e.g.*, Troc), to name a few) amides, cyclic imide derivatives, N-Alkyl and N-Aryl amines, imine derivatives, and enamine derivatives, to name a few. Certain other exemplary protecting groups are detailed herein, however, it will be appreciated that the present invention is not intended to be limited to these protecting groups; rather, a variety of additional equivalent protecting groups can be readily identified using the above criteria and utilized in the present invention. Additionally, a variety of protecting groups are described in "Protective Groups in Organic Synthesis" Third Ed. Greene, T.W. and Wuts, P.G., Eds., John Wiley & Sons, New York: 1999, the entire contents of which are hereby incorporated by reference

[0014] It will be appreciated that the compounds, as described herein, may be substituted with any number of substituents or functional moieties. In general, the term "substituted" whether preceded by the term "optionally" or not, and substituents contained in formulas of this invention, refer to the replacement of hydrogen radicals in a given structure with the radical of a specified substituent. When more than one position in any given structure may be substituted with more than one substituent selected from a specified group, the substituent may be either the same or different at every position. As used herein, the term "substituted" is contemplated to include all permissible substituents of organic compounds. In a broad aspect, the permissible substituents include acyclic and cyclic, branched and unbranched, carbocyclic and heterocyclic, aromatic and non-aromatic substituents of organic compounds. For purposes of this invention, heteroatoms such as nitrogen may have hydrogen substituents and/or any permissible substituents of organic compounds described herein which satisfy the valencies of the heteroatoms. Furthermore, this invention is

not intended to be limited in any manner by the permissible substituents of organic compounds. Combinations of substituents and variables envisioned by this invention are preferably those that result in the formation of stable compounds useful in the treatment and prevention, for example of disorders, as described generally above. The term "stable", as used herein, preferably refers to compounds which possess stability sufficient to allow manufacture and which maintain the integrity of the compound for a sufficient period of time to be detected and preferably for a sufficient period of time to be useful for the purposes detailed herein.

#### DESCRIPTION OF CERTAIN PREFERRED EMBODIMENTS OF THE INVENTION

[0037] As noted above, there has been increasing interest in recent years in the development of aspartyl protease inhibitors, particularly BACE inhibitors, as therapeutic agents for the treatment of Alzheimer's Disease and other disorders caused by the accumulation of  $\beta$ -amyloid plaques. It has been generally accepted by the scientific community that potential new leads for aspartyl inhibitor small molecules must comprise an aspartate binding hydroxyl group to retain aspartyl protease inhibitory activity (See for example, Ajay *et al.*, "Designing Libraries with CNS Activity", *J. Med. Chem.*, 42:4942-4951, 1999, see especially the paragraph bridging columns 1 and 2 on page 4942 of this article). The present invention demonstrates that amino analogs (*i.e.*, where the hydroxyl group has been replaced with an amino group) are unexpectedly equally promising (if not superior) aspartyl protease inhibitors as their hydroxy-containing counterparts. In fact, the present invention shows that certain amino-containing inventive compounds possess several superior biological properties over their hydroxy-containing counterparts (*e.g.*, increased potency in cells, increased selectivity for the BACE enzyme, and/or superior ADME properties).

[0038] Thus, the present invention provides novel amino-containing compounds capable of inhibiting the activity of BACE. More generally, the compounds of the invention are inhibitors of proteases, and more specifically inhibitors of aspartyl proteases. In certain embodiments of special interest, the inventive compounds are useful for the treatment or prevention of disorders characterized by  $\beta$  amyloid deposits or plaques. In certain exemplary embodiments, the compounds are useful for the treatment of Alzheimer's Disease.

[0039] Compounds of this invention include those generally set forth above and described specifically herein, and are illustrated in part by the various classes, subgenera and species disclosed herein.

[0040] Additionally, the present invention provides pharmaceutically acceptable derivatives of the inventive compounds, and methods of treating a subject using these

compounds, pharmaceutical compositions thereof, or either of these in combination with one or more additional therapeutic agents.

### [0367] 3) Pharmaceutical Compositions

[0368] As discussed above, certain of the compounds as described herein exhibit activity generally as inhibitors of aspartyl proteases and more specifically as inhibitors of  $\beta$ -secretase enzyme activity, and have the ability to halt or reduce the production of A  $\beta$  from APP and reduce or eliminate the formation of  $\beta$ -amyloid deposits in the brain. Thus, the compounds are useful for treating humans or animals suffering from a condition characterized by a pathological form of  $\beta$ -amyloid peptide, such as  $\beta$ -amyloid plaques, and for helping to prevent or delay the onset of such a condition. Thus, in certain embodiments, compounds of the invention are useful for treating Alzheimer's disease, for helping prevent or delay the onset of Alzheimer's disease, for treating patients with MCI (mild cognitive impairment) and preventing or delaying the onset of Alzheimer's disease in those who would progress from MCI to AD, for treating Down's syndrome, for treating humans who have Hereditary

Cerebral Hemorrhage with Amyloidosis of the Dutch-Type, for treating cerebral amyloid angiopathy and preventing its potential consequences, *i.e.* single and recurrent lobar hemorrhages, for treating other degenerative dementias, including dementias of mixed vascular and degenerative origin, dementia associated with Parkinson's disease, dementia associated with progressive supranuclear palsy, dementia associated with cortical basal degeneration, and diffuse Lewy body type Alzheimer's disease. The compounds and compositions of the invention are particularly useful for treating or preventing Alzheimer's disease. When treating or preventing these diseases, the compounds of the invention can either be used individually or in combination.

[0369] Accordingly, in another aspect of the present invention, pharmaceutical compositions are provided, which comprise any one of the compounds described herein (or a prodrug, pharmaceutically acceptable salt or other pharmaceutically acceptable derivative thereof), and optionally comprise a pharmaceutically acceptable carrier. In certain embodiments, these compositions optionally further comprise one or more additional therapeutic agents. Alternatively, a compound of this invention may be administered to a patient in need thereof in combination with the administration of one or more other therapeutic agents. For example, additional therapeutic agents for conjoint administration or inclusion in a pharmaceutical composition with a compound of this invention may be an approved agent for the treatment of Alzheimer's Disease, or it may be any one of a number of agents undergoing approval in the Food and Drug Administration that ultimately obtain approval for the treatment any disorder suffering from a condition characterized by a pathological form of  $\beta$ -amyloid peptide. It will also be appreciated that certain of the compounds of present invention can exist in free form for treatment, or where appropriate, as a pharmaceutically acceptable derivative thereof. According to the present invention, a pharmaceutically acceptable derivative includes, but is not limited to, pharmaceutically acceptable salts, esters, salts of such esters, or a pro-drug or other adduct or derivative of a compound of this invention which upon administration to a patient in need is capable of providing, directly or indirectly, a compound as otherwise described herein, or a metabolite or residue thereof.

[0370] As used herein, the term "pharmaceutically acceptable salt" refers to those salts which are, within the scope of sound medical judgment, suitable for use in

contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts of amines, carboxylic acids, and other types of compounds, are well known in the art. For example, S.M. Berge, *et al.* describe pharmaceutically acceptable salts in detail in *J. Pharmaceutical Sciences*, 66: 1-19 (1977), incorporated herein by reference. The salts can be prepared *in situ* during the final isolation and purification of the compounds of the invention, or separately by reacting a free base or free acid function with a suitable reagent, as described generally below. For example, a free base function can be reacted with a suitable acid. Furthermore, where the compounds of the invention carry an acidic moiety, suitable pharmaceutically acceptable salts thereof may, include metal salts such as alkali metal salts, *e.g.* sodium or potassium salts; and alkaline earth metal salts, *e.g.* calcium or magnesium salts. Examples of pharmaceutically acceptable, nontoxic acid addition salts are salts of an amino group formed with inorganic acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid and perchloric acid or with organic acids such as acetic acid, oxalic acid, maleic acid, tartaric acid, citric acid, succinic acid or malonic acid or by using other methods used in the art such as ion exchange. Other pharmaceutically acceptable salts include adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptonate, glycerophosphate, gluconate, hemisulfate, heptanoate, hexanoate, hydroiodide, 2-hydroxy-ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3-phenylpropionate, phosphate, picrate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, p-toluenesulfonate, undecanoate, valerate salts, and the like. Representative alkali or alkaline earth metal salts include sodium, lithium, potassium, calcium, magnesium, and the like. Further pharmaceutically acceptable salts include, when appropriate, nontoxic ammonium, quaternary ammonium, and amine cations formed using counterions such as halide, hydroxide, carboxylate, sulfate, phosphate, nitrate, loweralkyl sulfonate and aryl sulfonate.

[0371] Additionally, as used herein, the term "pharmaceutically acceptable ester" refers to esters that hydrolyze *in vivo* and include those that break down readily

in the human body to leave the parent compound or a salt thereof. Suitable ester groups include, for example, those derived from pharmaceutically acceptable aliphatic carboxylic acids, particularly alkanoic, alkenoic, cycloalkanoic and alkanedioic acids, in which each alkyl or alkenyl moiety advantageously has not more than 6 carbon atoms. Examples of particular esters include formates, acetates, propionates, butyrates, acrylates and ethylsuccinates.

[0372] Furthermore, the term "pharmaceutically acceptable prodrugs" as used herein refers to those prodrugs of the compounds of the present invention which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals with undue toxicity, irritation, allergic response, and the like, commensurate with a reasonable benefit/risk ratio, and effective for their intended use, as well as the zwitterionic forms, where possible, of the compounds of the invention. The term "prodrug" refers to compounds that are rapidly transformed *in vivo* to yield the parent compound of the above formula, for example by hydrolysis in blood. A thorough discussion is provided in T. Higuchi and V. Stella, Pro-drugs as Novel Delivery Systems, Vol. 14 of the A.C.S. Symposium Series, and in Edward B. Roche, ed., Bioreversible Carriers in Drug Design, American Pharmaceutical Association and Pergamon Press, 1987, both of which are incorporated herein by reference.

[0373] As described above, the pharmaceutical compositions of the present invention additionally comprise a pharmaceutically acceptable carrier, which, as used herein, includes any and all solvents, diluents, or other liquid vehicle, dispersion or suspension aids, surface active agents, isotonic agents, thickening or emulsifying agents, preservatives, solid binders, lubricants and the like, as suited to the particular dosage form desired. Remington's Pharmaceutical Sciences, Sixteenth Edition, E. W. Martin (Mack Publishing Co., Easton, Pa., 1980) discloses various carriers used in formulating pharmaceutical compositions and known techniques for the preparation thereof. Except insofar as any conventional carrier medium is incompatible with the compounds of the invention, such as by producing any undesirable biological effect or otherwise interacting in a deleterious manner with any other component(s) of the pharmaceutical composition, its use is contemplated to be within the scope of this invention. Some examples of materials which can serve as pharmaceutically acceptable carriers include, but are not limited to, sugars such as lactose, glucose and sucrose; starches such as corn starch and potato starch; cellulose and its derivatives

such as sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered tragacanth; malt; gelatine; talc; excipients such as cocoa butter and suppository waxes; oils such as peanut oil, cottonseed oil; safflower oil, sesame oil; olive oil; corn oil and soybean oil; glycols; such as propylene glycol; esters such as ethyl oleate and ethyl laurate; agar; buffering agents such as magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogenfree water; isotonic saline; Ringer's solution; ethyl alcohol, and phosphate buffer solutions, as well as other non-toxic compatible lubricants such as sodium lauryl sulfate and magnesium stearate, as well as coloring agents, releasing agents, coating agents, sweetening, flavoring and perfuming agents, preservatives and antioxidants can also be present in the composition, according to the judgment of the formulator.

[0374] Liquid dosage forms for oral administration include, but are not limited to, pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethylformamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof. Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

[0375] Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution, suspension or emulsion in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, U.S.P. and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid are used in the preparation of injectables.

[0376] The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium prior to use.

[0377] In order to prolong the effect of a drug, it is often desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension or crystalline or amorphous material with poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution that, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle. Injectable depot may form are made by forming microcapsule matrices of the drug in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of drug to polymer and the nature of the particular polymer employed, the rate of drug release can be controlled. Examples of other biodegradable polymers include (poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the drug in liposomes or microemulsions which are compatible with body tissues.

[0378] Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating excipients or carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at ambient temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

[0379] Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is mixed with at least one inert, pharmaceutically acceptable excipient or carrier such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol, and silicic acid, b) binders such as, for example, carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidone, sucrose, and acacia, c) humectants such as glycerol, d) disintegrating agents such as agar--agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate, e) solution retarding agents such as paraffin, f) absorption accelerators such as quaternary ammonium compounds, g) wetting agents such as, for example,

cetyl alcohol and glycerol monostearate, h) absorbents such as kaolin and bentonite clay, and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

[0380] Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings and other coatings well known in the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions that can be used include polymeric substances and waxes. Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

[0381] The active compounds can also be in micro-encapsulated form with one or more excipients as noted above. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings, release controlling coatings and other coatings well known in the pharmaceutical formulating art. In such solid dosage forms the active compound may be admixed with at least one inert diluent such as sucrose, lactose and starch. Such dosage forms may also comprise, as in normal practice, additional substances other than inert diluents, *e.g.*, tableting lubricants and other tableting aids such as magnesium stearate and microcrystalline cellulose. In the case of capsules, tablets and pills, the dosage forms may also comprise buffering agents. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions that can be used include polymeric substances and waxes.

[0382] Dosage forms for topical or transdermal administration of a compound of this invention include ointments, pastes, creams, lotions, gels, powders, solutions, sprays, inhalants or patches. The active component is admixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives or

buffers as may be required. Ophthalmic formulation, eardrops, and eye drops are also contemplated as being within the scope of this invention. Additionally, the present invention contemplates the use of transdermal patches, which have the added advantage of providing controlled delivery of a compound to the body. These dosage may form are made by dissolving or dispensing the compound in the proper medium. Absorption enhancers can also be used to increase the flux of the compound across the skin. The rate can be controlled by either providing a rate controlling membrane or by dispersing the compound in a polymer matrix or gel.

[0383] It will also be appreciated that the compounds and pharmaceutical compositions of the present invention can be formulated and employed in combination therapies, that is, the compounds and pharmaceutical compositions can be formulated with or administered concurrently with, prior to, or subsequent to, one or more other desired therapeutics or medical procedures. For example, compounds of the invention can be used in combination, with each other, or with other therapeutic agents or approaches used to treat or prevent the conditions described above and herein. Exemplary agents include, but are not limited to: acetylcholine esterase inhibitors such as tacrine (tetrahydroaminoacridine, marketed as COGNEX®), donepezil hydrochloride (marketed as Aricept® and rivastigmine (marketed as Exelon®); gamma-secretase inhibitors; anti-inflammatory agents such as cyclooxygenase II inhibitors; anti-oxidants such as Vitamin E and ginkgolides; immunological approaches, such as, for example, immunization with A  $\beta$  peptide or administration of anti-A  $\beta$  peptide antibodies; statins; and direct or indirect neurotropic agents such as Cerebrolysin®, AIT-082 (Emilieu, 2000, *Arch. Neurol.* 57:454), and other neurotropic agents of the future. The particular combination of therapies (therapeutics or procedures) to employ in a combination regimen will take into account compatibility of the desired therapeutics and/or procedures and the desired therapeutic effect to be achieved. It will also be appreciated that the therapies employed may achieve a desired effect for the same disorder (for example, an inventive compound may be administered concurrently with another Alzheimer's agent), or they may achieve different effects (e.g., control of any adverse effects). In certain embodiments, the pharmaceutical compositions of the present invention further comprises one or more additional therapeutically active ingredients (e.g., palliative). For purposes of the invention, the term "Palliative" refers to treatment

that is focused on the relief of symptoms of a disease and/or side effects of a therapeutic regimen, but is not curative. For example, palliative treatment encompasses painkillers, antinausea medications and anti-sickness drugs.

[0384]        4)        **Research Uses, Pharmaceutical Uses and Methods of Treatment**

[0392] *Pharmaceutical Uses and Methods of Treatment*

[0393] As discussed above, without wishing to be bound by any particular theory, certain of the compounds as described herein exhibit activity generally as inhibitors of aspartyl proteases and more specifically as inhibitors of  $\beta$ -secretase enzyme activity. In certain embodiments compounds exhibit the ability to halt or reduce the production of A  $\beta$  from APP and reduce or eliminate the formation of  $\beta$ -amyloid deposits in the brain and thus the compounds are useful for treating humans or animals suffering from a condition characterized by a pathological form of  $\beta$ -amyloid peptide, such as  $\beta$ -amyloid plaques, and for helping to prevent or delay the onset of such a condition (e.g., Alzheimer's Disease). Thus, in certain embodiments, compounds of the invention are useful for treating Alzheimer's disease, for helping prevent or delay the onset of Alzheimer's disease, for treating patients with MCI (mild cognitive impairment) and preventing or delaying the onset of Alzheimer's disease in those who would progress from MCI to AD, for treating Down's syndrome, for treating humans who have Hereditary Cerebral Hemorrhage with Amyloidosis of the Dutch-Type, for treating cerebral amyloid angiopathy and preventing its potential consequences, i.e. single and recurrent lobar hemorrhages, for treating other degenerative dementias, including dementias of mixed vascular and degenerative origin, dementia associated with Parkinson's disease, dementia associated with progressive supranuclear palsy, dementia associated with cortical basal degeneration, and diffuse Lewy body type Alzheimer's disease. The compounds and compositions of the invention are particularly useful for treating or preventing Alzheimer's disease.

When treating or preventing these diseases, the compounds of the invention can either be used individually or in combination.

[0394] In certain embodiments, the method involves the administration of a therapeutically effective amount of the compound or a pharmaceutically acceptable derivative thereof to a subject (including, but not limited to a human or animal) in need of it.

[0395] As described in more detail herein, in certain embodiments, compounds of the invention are useful as inhibitors of aspartyl proteases. Generally, compounds of the invention exhibit the ability to inhibit aspartyl protease enzyme activity and thus compounds of the invention generally are useful for the treatment of disorders mediated by aspartyl protease enzyme activity. More specifically, compounds of the invention exhibit activity as inhibitors of  $\beta$ -secretase enzyme activity and A  $\beta$  peptide production. Thus, in certain embodiments, the present invention provides compounds useful for the treatment of disorders mediated by a pathological form of  $\beta$ -amyloid peptide, such as  $\beta$  amyloid plaques, and for helping to prevent or delay the onset of such a condition.

[0396] Thus, in certain embodiments, compounds of the invention are useful for treating Alzheimer's disease, for helping prevent or delay the onset of Alzheimer's disease, for treating patients with MCI (mild cognitive impairment) and preventing or delaying the onset of Alzheimer's disease in those who would progress from MCI to AD, for treating Down's syndrome, for treating humans who have Hereditary Cerebral Hemorrhage with Amyloidosis of the Dutch-Type, for treating cerebral amyloid angiopathy and preventing its potential consequences, *i.e.* single and recurrent lobar hemorrhages, for treating other degenerative dementias, including dementias of mixed vascular and degenerative origin, dementia associated with Parkinson's disease, dementia associated with progressive supranuclear palsy, dementia associated with cortical basal degeneration, and diffuse Lewy body type Alzheimer's disease. The compounds and compositions of the invention are particularly useful for treating or preventing Alzheimer's disease. When treating or preventing these diseases, the compounds of the invention can either be used individually or in combination.

[0397] Thus, as described above, in another aspect of the invention, a method for the treatment of disorders useful for the treatment (or prevention) of disorders

mediated by a pathological form of  $\beta$ -amyloid peptide, such as  $\beta$  amyloid plaques, is provided comprising administering a therapeutically effective amount of a compound of Formula (I) or (I<sup>A</sup>), or any classes and subclasses of these compounds as described herein, to a subject in need thereof. It will be appreciated that the compounds and compositions, according to the method of the present invention, may be administered using any amount and any route of administration effective for the treatment of disorders by a pathological form of  $\beta$ -amyloid peptide, such as  $\beta$  amyloid plaques. Thus, the expression "effective amount" as used herein, refers to a sufficient amount of agent to inhibit the production of A  $\beta$  peptide, and to exhibit a therapeutic effect. The exact amount required will vary from subject to subject, depending on the species, age, and general condition of the subject, the severity of the infection, the particular therapeutic agent, its mode of administration, and the like. The compounds of the invention are preferably formulated in dosage unit form for ease of administration and uniformity of dosage. The expression "dosage unit form" as used herein refers to a physically discrete unit of therapeutic agent appropriate for the patient to be treated. It will be understood, however, that the total daily usage of the compounds and compositions of the present invention will be decided by the attending physician within the scope of sound medical judgment. The specific therapeutically effective dose level for any particular patient or organism will depend upon a variety of factors including the disorder being treated and the severity of the disorder; the activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed; and like factors well known in the medical arts (see, for example, Goodman and Gilman's, "The Pharmacological Basis of Therapeutics", Tenth Edition, A. Gilman, J. Hardman and L. Limbird, eds., McGraw-Hill Press, 155-173, 2001, which is incorporated herein by reference in its entirety).

[0398] Another aspect of the invention relates to a method for inhibiting  $\beta$ -secretase activity in a biological sample or a patient, which method comprises administering to the patient, or contacting said biological sample with a compound of formula I or a composition comprising said compound.

[0399] Furthermore, after formulation with an appropriate pharmaceutically acceptable carrier in a desired dosage, the pharmaceutical compositions of this invention can be administered to humans and other animals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments, or drops), buccally, as an oral or nasal spray, or the like, depending on the severity of the infection being treated. In certain embodiments, the compounds of the invention may be administered at dosage levels of about 0.001 mg/kg to about 50 mg/kg, from about 0.01 mg/kg to about 25 mg/kg, or from about 0.1 mg/kg to about 10 mg/kg of subject body weight per day, one or more times a day, to obtain the desired therapeutic effect. It will also be appreciated that dosages smaller than 0.001 mg/kg or greater than 50 mg/kg (for example 50-100 mg/kg) can be administered to a subject. In certain embodiments, compounds are administered orally or parenterally.

#### TREATMENT KIT

[0400] In other embodiments, the present invention relates to a kit for conveniently and effectively carrying out the methods in accordance with the present invention. In general, the pharmaceutical pack or kit comprises one or more containers filled with one or more of the ingredients of the pharmaceutical compositions of the invention. Such kits are especially suited for the delivery of solid oral forms such as tablets or capsules. Such a kit preferably includes a number of unit dosages, and may also include a card having the dosages oriented in the order of their intended use. If desired, a memory aid can be provided, for example in the form of numbers, letters, or other markings or with a calendar insert, designating the days in the treatment schedule in which the dosages can be administered. Alternatively, placebo dosages, or calcium dietary supplements, either in a form similar to or distinct from the dosages of the pharmaceutical compositions, can be included to provide a kit in which a dosage is taken every day. Optionally associated with such container(s) can be a notice in the form prescribed by a governmental agency regulating the manufacture, use or sale of pharmaceutical products, which notice reflects approval by the agency of manufacture, use or sale for human administration.

#### [0404] EXAMPLE 1

[0405] This example describes the enzyme assay for determining the apparent  $K_i$  of the compounds of the present invention.

[0406] The BACE enzyme used for inhibition analyses, BACE-HT, was produced from baculovirus-infected insect cells, and corresponded to the pro form of the soluble N-terminal protease domain (residues 22-454, starting from the N-terminal methionine), followed by a short linker and C-terminal 6X His tag.

[0407] Compounds were tested for their ability to inhibit BACE hydrolysis of the internally quenched fluorescent substrate, FS-1 (Emmoliéff *et al.*, Biochemistry 39:12450-12456 (2000)):

FS1:  $\text{NH}_2$ -Arg-Glu(EDANS)-Glu-Val-Asn-Leu- -Asp-Ala-Glu-Phe-Lys(DABCYL)-Arg-COOH

FS-2: MOCAc-Ser-Glu-Val-Asn-Leu- -Asp-Ala-Glu-Phe-Lys(DNP)-Arg-Arg-COOH

where EDANS is 5-((2-aminoethyl)amino)naphthalene-1-sulfonic acid; DABCYL is 4-((4-dimethylamino)phenyl)azo)benzoic acid; MOCAC is 7-methoxycoumarin-4-yl) acetic acid; and DNP is 2,4-dinitrophenylacetic acid.

[0408] FS-1 and FS-2 correspond to the Swedish APP  $\beta$ -site sequence, flanked by either an EDANS or MOCAC fluorophore on the N-terminus and a DABCYL or DNP quenching group near the C-terminus. In the intact state, the DABCYL or DNP group quenches the EDANS or MOCAC (respectively) fluorescence by virtue of their close proximity. In the intact state, the DABCYL group quenches the EDANS fluorescence by virtue of their close proximity. Upon cleavage at the site indicated by the arrow by BACE, the quenching is relieved and fluorescence is observed using  $\lambda_{\text{excitation}} = 350 \text{ nm}$  and  $\lambda_{\text{emission}} = 490 \text{ nm}$  or  $\lambda_{\text{excitation}} = 328 \text{ nm}$  and  $\lambda_{\text{emission}} = 440 \text{ nm}$  (MOCAC). For determination of apparent inhibition constant ( $K_i^{\text{app}}$ ) for various inhibitors, the initial rates of FS-1 hydrolysis in the presence of various concentrations of inhibitors were measured and fit to the Morrison equation (Williams and Morrison, Methods Enzymol. 63: 437-467 (1979)):

$$v = v_0 \cdot \frac{[E]_0 - [I]_0 - K_i^{\text{app}} + \sqrt{([E]_0 - [I]_0 - K_i^{\text{app}})^2 + 4[E]_0 K_i^{\text{app}}}}{2[E]_0}$$

where  $v$  is the initial rate measured in the presence of  $[I]_0$ , the inhibitor concentration, using an enzyme concentration  $[E]_0$ .  $v_0$  is the initial rate measured in the absence of inhibitor.

[0409] Inhibitors were resuspended in DMSO and serially diluted in DMSO at 20x final assay concentration. Compound dilutions (5  $\mu\text{L}$ ) were transferred to Black non-treated 96-well microtiter plates, and resuspended in 85  $\mu\text{L}$  35.3  $\mu\text{M}$  FS1 substrate in 100 mM sodium acetate buffer, pH 4.5, containing 5.9% DMSO (*i.e.* 10% final DMSO in assay). Following brief equilibration to room temperature, the reactions were initiated by the addition of 10  $\mu\text{L}$  BACE-HT (100nM final concentration) and brief mixing. The increase in EDANS fluorescence over time was monitored on a Gemini XS fluorometric plate reader using Softmax pro software. Initial rates were fit to the Morrison equation and  $K_i^{\text{app}}$ 's determined using Graphpad Prism software. A representative range of  $K_i^{\text{app}}$ 's for the compounds is between 1-1000 nM. The range of  $K_i^{\text{app}}$ 's for preferred compounds is 0.1-500 nM.

[0410]       **EXAMPLE 2**

[0411]       This example describes an illustrative set of cell-based assays for testing the ability of the compounds of the present invention to inhibit the secretion of the A $\beta$  peptide from cells expressing high levels of the human amyloid precursor protein ("APP").

[0412]       A representative set of such cells include A-204 rhabdomyosarcoma cells, human embryonic kidney 293 cells transiently transfected with APP, Chinese hamster ovary cells stably transfected with APP (CHO2B7), and H4 neuroglioma cells stably transfected with APP (H4  $\beta$ 695wt). The A-204 cells and HEK 293 cells were obtained from ATCC. For HEK 293 transient transfections, a pcDNA3 plasmid containing the human APP gene was obtained from Invitrogen, and cells were transfected with FuGENE 6 transfection reagent (Roche) following manufacturer's protocols. The CHO2B7 and H4  $\beta$ 695wt lines were obtained from Mayo Clinic (*J. Neuroscience Methods* 108(2): 171-9 (2001)).

[0413]       The following media were used for the cell lines: DMEM + glucose, glutamine, sodium pyruvate, pyridoxine-HCl, antibiotics, and 10% FBS (A-204 cells); DMEM + glucose, glutamine, sodium pyruvate, pyridoxine-HCl, non-essential amino acids, antibiotics, and 10% FBS (HEK 293 cells); Ham's F-12 + antibiotics, 10% FBS, and 400  $\mu$ g/ml Zeocin (CHO2B7 cells); and Opti-MEM (Invitrogen)+ antibiotics, 10% FBS, and 500  $\mu$ g/ml geneticin(H4  $\beta$ 695wt cells).

[0414]       In the assay, cells were pre-treated with compounds for 1-2 hours to "wash out" any A $\beta$  in the secretory pathway prior to incubation with compounds for the conditioning period required to generate detectable concentrations of A $\beta$ . The production of secreted A $\beta$  in cultured cells was monitored by sandwich ELISA, using the anti-A $\beta$  monoclonal antibodies 6E10 and 4G8 (Signet Laboratories). The antibody 6E10 (specific to amino acids 1-17 of A $\beta$ ) was immobilized to the plate and used for capture, and a biotinylated version of the antibody 4G8 (specific to amino acids 17-24 of A $\beta$ ) was used for detection, via subsequent treatment with Neutravidin-horseradish peroxidase conjugate and development with luminescent substrate.

[0415]       Cells were plated at  $2.5 \times 10^5$  cells/well (HEK293 cells in 24 well poly-D-lysine coated plate),  $1.3 \times 10^5$  cells/well (A-204 cells) (48 well plates) or  $5 \times 10^4$  cells/well (CHO2B7 and H4APP cells) (96 well plates) in appropriate media (500  $\mu$ L

per well for 24 well plates, 300  $\mu$ L per well for 48 well plates, 150  $\mu$ L per well for 96 well plates) and grown at 37° C and 5% CO<sub>2</sub> for 16-20 h. Media was aspirated and replaced with appropriate media plus 0.1% DMSO and various concentrations of inhibitors, prepared by resuspension of the appropriate volume of a 1000X solution of inhibitor in DMSO with media on a separate plate. Cells and inhibitors were incubated for 1-2 hours, followed by aspiration of the media and replacement with fresh media solutions having the same concentrations of inhibitors. After a 4-24 hour incubation period (depending on cell type), conditioned media were collected and 100  $\mu$ L of each sample applied to wells of Nunc Maxisorp white 96-well plates that had been previously coated with 10  $\mu$ g/mL 6E10 antibody in 50 mM Na<sub>2</sub>CO<sub>3</sub>, (pH 9.0) overnight at 4° C, blocked with Superblock in PBS (Pierce Chemicals; PBS=10 mM sodium phosphate + 150 mM NaCl, pH 7.4) for 1 hour at room temperature, and washed 3 times in wash buffer (PBS plus 0.05% Tween 20). Binding was allowed to take place overnight at 4 °C, and plates were then washed 8 times and treated with 100  $\mu$ L/well of 10 nM biotinylated 4G8 antibody in binding buffer (superblock in PBS plus 0.05% Tween 20) for 1 hour at room temperature. Plates were washed 8 times, treated with 100  $\mu$ L/well of 1.5  $\mu$ g/ Neutravidin-horseradish peroxidase conjugate (Pierce Chemicals) for 40 minutes at room temperature, washed an additional 8 times, and developed with 100  $\mu$ L/well Supersignal luminescent substrate (Pierce Chemicals) for 2 minutes. Luminescence was measured on a Gemini XS fluorescence/luminescence plate reader, and translated into A $\beta$  concentrations using an internal standard curve of known A $\beta$  concentrations (A $\beta$  1-40 obtained from Oncogene). In general, IC<sub>50</sub>'s of the compounds of the present invention range from about 5X to about 15X the observed K<sub>i</sub><sup>app</sup>'s against the BACE enzyme as determined using the method of Example 1.

[0416]        **EXAMPLE 3**

[0417]        This example describes permeability experiments using MDCK cells.

[0418]        MDCK cells, derived from canine kidney, were obtained from American Type Culture Collection (ATCC, Rockville, MD). Cells were cultured in DMEM medium supplemented with 10% fetal bovine serum, 1 mM sodium pyruvate and 0.01 mg/ml gentamicin. Cells were maintained in a humidified atmosphere with 5% CO<sub>2</sub> at 37°C. For transport studies, cells were plated at a density of 50 x 10<sup>3</sup>

cells/cm<sup>2</sup> on 0.4 µm pore size Transwell™ polyester membranes (Corning, Corning, NY). Culture medium was replaced every two days until a tight cell monolayer was formed as measured by preliminary R123 permeability measurements. Compounds, 10 µM, were placed in either the apical or basolateral compartment and the amount of drug in the opposite chamber was measured using LC/MS/MS or fluorometry. The permeability coefficient was calculated using the following equation:

$$P_{app} = (1/AC_0) dQ/dt$$

where A= surface area of the cell monolayers, C<sub>0</sub> is the initial concentration and  $dQ/dt$  represents the amount of drug flux in a specified time.

**[0419]        EXAMPLE 4**

**[0420]**        This example describes pharmacokinetic experiments for determining peak plasma and peak brain concentrations using Adult Swiss Weber mice. The peak brain concentration determination also served as a measure for assessing whether the compounds were able to cross the blood brain barrier.

**[0421]**        Adult Swiss Webster mice were administered compounds via tail vein injection.

Plasma and brain tissue were collected at 0, 0.5, 1, 2, 3, 4, and 8 hrs. Blood was collected via cardiac puncture. Subsequently, animals were perfused intra-cardially with ice-cold saline; the brain was homogenized in 10 volumes of ice-cold Tris-buffered saline (20 mM Tris, 137 mM NaCl, pH 7.6) and was then frozen at -20 °C. Following extraction, compound concentrations in plasma and brain homogenates were measured by LC/MS/MS. Peak plasma and brain concentrations (C<sub>max</sub>) and time to achieve these concentrations (T<sub>max</sub>) were measured directly from concentration versus time profiles. Descriptive pharmacokinetic parameters were calculated using the WinNonlin software package (Pharsight Inc., Mountain View CA). Figure 1A and 1B are the plasma and brain concentration curves respectively for one of the compounds of the present invention (where each data point is an average concentration from three mice). This compound has a molecular weight of 626, has a K<sub>i</sub><sup>app</sup> of about 35 nM with a 125 fold selectivity over Cat D, and has an IC<sub>50</sub> in cells of about 220 nM.

**[0422] EXAMPLE 5**

**[0423]** This example compares the biological properties of a hydroxy-containing compound with an amino-containing compound. The two compounds are of the structure

where R is either OH or NH<sub>2</sub>. In a surprising and unexpected finding, the amino-containing compound possesses several superior biological properties over its hydroxy-containing counterpart.

**[0424]** As it can be seen in the following Table, the amino compound is more potent in cells, is more selective for the BACE enzyme, and show superior ADME properties than its hydroxy counterpart.

Compound	BACE K <sub>i</sub>	IC <sub>50</sub> (H4 cells)	Cat D K <sub>i</sub>	% recovery liver microsomes
R = OH	150 nM	2000 nM	20 nM	0% at 60 minutes
R = NH <sub>2</sub>	180 nM	740 nM	610 nM	43% at 60 minutes

**[0425]** Although both compounds show similar activity against the BACE enzyme (180 nM versus 150 nM), the amino compound is significantly more potent in cells (740 nM versus 2000 nM). Moreover, the amino compound displays over a three fold preference for BACE over Cat D. In contrast, the hydroxy counterpart displays a 7.5 fold preference for Cat D over BACE. In addition, although both the amino and hydroxy compounds were stable in human plasma (100% recovery at 1 hour), the amino compound is much more stable in liver microsomes than its hydroxy counterpart.

**[0426]** These trends appear to be a general phenomenon and have been observed in several scaffolds in addition to one exemplified above.

**[0427]** The K<sub>i</sub> for BACE and the IC<sub>50</sub> determinations were performed as described in Examples 1 and 2 respectively.

**[0428]** The K<sub>i</sub> determination for Cat D was performed using the assay conditions derived from Haque *et al.*, *J. Med. Chem.* 42: 1428-1440 (1999) and the following substrate:

DABCYL-GLu-Arg-Nle-Phe-Leu-Ser-Phe-Pro-EDANS where Nle is norleucine and DABCYL and EDANS are as previously defined.

[0429] Plasma stability was determined by incubating the compounds in human plasma at a concentration of 1  $\mu$ M at 37 °C for 0, 30 and 60 minutes. Reactions were stopped by addition of acetonitrile. Protein was precipitated by centrifugation (3000 rpm x 10 min) then supernatants were analyzed for remaining parent compound by LC/MS/MS.

[0430] Metabolic stability was determined by incubating the compounds with human liver microsomes (100  $\mu$ g/ml) in 100 mM Tris buffer pH 7.4 for 5 minutes at 37 °C. Metabolic reactions were started by addition of NADPH to give a final concentration of 1  $\mu$ M. Reactions were stopped after 30 and 60 minutes by addition of acetonitrile. Protein was precipitated by centrifugation (3000 rpm x 10 min) then supernatants were analyzed for remaining parent compound by LC/MS/MS.

[0435] **General Reaction Procedures:**

[0436] Unless mentioned specifically, reaction mixtures were stirred using a magnetically driven stirrer bar. An inert atmosphere refers to either dry argon or dry nitrogen. Reactions were monitored either by thin layer chromatography, by proton nuclear magnetic resonance (NMR) or by high-pressure liquid chromatography (HPLC), of a suitably worked up sample of the reaction mixture.

[0437] **General Work Up Procedures:**

[0438] Unless mentioned specifically, reaction mixtures were cooled to room temperature or below then quenched, when necessary, with either water or a saturated aqueous solution of ammonium chloride. Desired products were extracted by partitioning between water and a suitable water-immiscible solvent (e.g. ethyl acetate, dichloromethane, diethyl ether). The desired product containing extracts were washed appropriately with water followed by a saturated solution of brine. On occasions where the product containing extract was deemed to contain residual oxidants, the extract was washed with a 10% solution of sodium sulphite in saturated aqueous sodium bicarbonate solution, prior to the aforementioned washing procedure. On occasions where the product containing extract was deemed to contain residual acids, the extract was washed with saturated aqueous sodium bicarbonate solution, prior to the aforementioned washing procedure (except in those cases where the desired product itself had acidic character). On occasions where the product containing extract was deemed to contain residual bases, the extract was washed with 10% aqueous citric acid solution, prior to the aforementioned washing procedure (except in those cases where the desired product itself had basic character). Post washing, the desired product containing extracts were dried over anhydrous magnesium sulphate, and then filtered. The crude products were then isolated by removal of solvent(s) by rotary evaporation under reduced pressure, at an appropriate temperature (generally less than 45°C).

[0439]        **General Purification Procedures:**

[0440]        Unless mentioned specifically, chromatographic purification refers to flash column chromatography on silica, using a single solvent or mixed solvent as eluent. Suitably purified desired product containing elutes were combined and concentrated under reduced pressure at an appropriate temperature (generally less than 45°C) to constant mass. Final compounds were dissolved in 50% aqueous acetonitrile, filtered and transferred to vials, then freeze-dried under high vacuum before submission for biological testing.

[0441]        **Synthesis of Exemplary Compounds:**

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US 03/18858

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 86-88  
because they relate to subject matter not required to be searched by this Authority, namely:  
see FURTHER INFORMATION sheet PCT/ISA/210
2. ☒ Claims Nos.: 1-6, 8-10, 14, 15, 19, 20, 24, 25, 29, 30, 32-35, 37-43, 45-47, 52, 53  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

### Continuation of Box I.1

Although claims 86-88 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

-----

### Continuation of Box I.1

Claims Nos.: 86-88

Rule 39.1(iv) PCT - Method for treatment of the human or animal body by therapy

-----

### Continuation of Box I.2

Claims Nos.: 1-6,8-10,14,15,19,20,24,25,29,30,32-35,37-43,45-47,52,53

The initial phase of the search revealed a very large number of documents relevant to the issue of novelty. So many documents were retrieved that it is impossible to determine which parts of the claims may be said to define subject-matter for which protection might legitimately be sought (Article 6 PCT). For these reasons, a meaningful search over the whole breadth of the claims is impossible. Consequently, the search has been restricted to the subject-matter of claims 7,13,18,23,28,36,44 when R0 is H and claims 11,12,16,17,21,22,26,27,31,48,49,50,51 and claims 54-82 (when R0 is H and Rx2 is methyl as well as all the exemplified compounds. As regard to the use claims 84-88 the search is complete.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
